

COMPITO 6: USABILITY TESTING REPORT – MICROMOVE

Author: Jesus Mantas Villafranca

Project: MicroMove (Individual Group)

Academic Year: 2025-2026

1. Introduction

This document details the usability testing phase for MicroMove, a mobile application designed to facilitate discreet micro-breaks for students in library environments.

2. Methodology

Participants: User 1 (Engineering Student at politecnico di Milano age, 20).

Location: Politecnico di Milano (BCT)

Equipment: High-Fidelity Figma prototype running on a smartphone.

Method: Think Aloud Protocol (the user was asked to verbalize their thoughts during the interaction).

3. Test Script (The protocol)

The session was structured into three main scenarios:

Task 1 (Simple): Respond to a Reminder.

Context: "You have been studying for 90 minutes. You feel a vibration in your pocket." *Goal:* Open the notification and confirm the execution of a neck-stretch exercise.

Task 2 (Moderate): Session Setup.

Context: "You are entering a quiet study room and want to start a 2-hour session with silent alerts." *Goal:* Set the duration to 2 hours, enable 'Library Mode', and start the timer.

Task 3 (Complex): Progress Management.

Context: "It's the end of the day and you want to see if you moved enough." *Goal:* Access the statistics dashboard and identify the total 'Active Minutes' for the week

Task	Completion Rate	Time on Task	Errors	Satisfaction (1-5)
Task 1	100% (Success)	12 seconds	0	5/5

Task 2	100% (Success)	25 seconds	0	4/5
Task 3	100% (Success)	18 seconds	0	5/5

5. Qualitative Feedback & Observations

The testing session was highly successful. The user provided the following feedback:

Visual Design: The "Polimi Blue" color palette felt familiar and professional. The UI was described as "clean and non-distracting."

Discretion: The participant specifically praised the "Library Mode" feature, stating that they would feel comfortable using the app without worrying about social judgment.

Usability: The navigation was intuitive. The user noted: *"The icons for the exercises are very clear; I knew exactly what movement to do without reading long instructions."*

Critical Incidents: No major usability catastrophes were found. The user suggested that the "Start" button could be slightly larger for better accessibility, which was addressed in the final refinement.

6. Final Refinements (Closing the Loop)

Based on the testing session, the following minor adjustments were made to the High-Fidelity prototype:

Button Sizing: Increased the touch target of the "Start Session" button to improve ergonomics.

Contrast: Slightly increased the contrast of the sedentary progress bar for better visibility under different lighting conditions in the library.

Labeling: Renamed "Stats" to "My Progress" to make the section feel more personal and encouraging.

7. Conclusion

The High-Fidelity prototype of MicroMove successfully meets the user needs identified during the Needfinding phase. The app effectively balances the requirement for physical wellness with the social constraints of shared study spaces.
